

What is environmental stress screening?

Environmental stress screening (ESS) refers to the process of exposing a newly manufactured or repaired product or component (typically electronic) to stresses such as thermal cycling and vibration in order to force latent defects to manifest themselves by permanent or catastrophic failure during the screening process.

What is ESS testing?

ESS is a "shake and bake" form of testing where products are subjected to temperature fluctuations while being shaken to ensure their durability.

What is the temperature range for environmental stress testing?

For industrial products, the common range is $-40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$. To perform environmental stress testing, a shaker - for example, a V875 (or V8750 - coming soon) with a thermally-conditioned fixture and a thermal barrier - is fitted to an environmental chamber so that only the payload and the shaker fixture are inside the chamber.

What is an ESS system?

ESS can be performed as part of the manufacturing process or it can be used in new product qualification testing.

An ESS system usually consists of a test chamber, controller, fixturing, interconnect and wiring, and a functional tester.

These systems can be purchased from a variety of companies in the environmental test industry.

What is ESS test temperature?

ESS is common for military products and components that often operate at extreme temperatures and for industrial products such as automotive components - both engine components and in-cabin assemblies.

For military products, the testing temperature range is $-55\text{ }^{\circ}\text{C}$ to $+125\text{ }^{\circ}\text{C}$.

For industrial products, the common range is $-40\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$.

Should ESS testing be increased?

Note: Types and levels of testing may have to be increased if infant mortality failures are occurring in operational use.

Conversely, if a statistically significant sampling demonstrates that infant mortality failures are not occurring, ESS tests may be reduced or eliminated.

Functional Testing is still required.
